Title: Stability (Variation A)
Duration: 2m 00s (**205** words; 194 words + 11w Bridge)

Script Content:
[Intro]

Welcome to this practice. Today we will explore the concept of Stability.

In our daily lives, we often think of "sitting still" as doing nothing. We assume that when we stop moving, our body simply rests. However, from a mechanical perspective, remaining upright requires continuous, active work.

Gravity is constantly pulling us downward. To stay upright, our skeletal structure must resist this force. Consider the steel framework of a bridge. It stands tall not because it is resting, but because every beam is actively holding its position against the heavy downward pull.

If we were truly "doing nothing," we would collapse. Therefore, stillness is not passive; it is an active state of balance.

Stability is the ability of a structure to maintain its position despite these forces. Think of a skyscraper or a radio tower. They look motionless, but they are constantly managing stress, wind, and gravity to stay vertical.

When we practice Stability, we treat our current activity as an engineered system. We act like engineers. We build a strict, solid base. We actively check for weak spots and fix them.

We monitor our work to ensure the entire system stays perfectly centered.

[Bridge] Now, we will move into a short practice to explore this.
