Title: Oral Hygiene Analysis

Duration: 10m 00s (735 words)

Script Content:

[Practice]

When you're ready, let's begin this practice.

Today, you have an opportunity to audit the technique of brushing your teeth. Specifically, we will bring attention to the mechanics of the task: the condition of the tools, the lighting conditions, the surface friction, and the timing.

Let this audio play in the background and follow the instructions as best you can. At any time, you can adapt the instructions to support the way you verify your brushing technique.

So, let's practice.

You should start by conducting a physical setup of the environment before you begin. For example, you can evaluate the spatial arrangement of where your toothbrush is located.

Verify whether the current lighting levels are bright enough for you to see the details clearly. Determine if the countertop is organized effectively or if it appears cluttered. Log these facts in your mind without needing to change them immediately.

[Short Pause] (10s - Room analysis)

Take note of the specific colors and shapes that are present within your visual field. Verify if there is a window open or closed, and assess the ventilation in the room. Identify if there are any specific chemical smells coming from soaps or grooming products.

[Short Pause] (10s - Sensory annotation)

And now, as you prepare to reach for your toothbrush, pay attention to the physical movement. What is involved in this routine action? Evaluate your speed. Determine if you are moving efficiently, or if you are rushing through the motion without precision.

Now, direct your attention to the toothbrush in your hand to inspect the tool. Examine the color and the ergonomic design of the grip. Look closely at the bristles to verify they are straight and effective, or if they are bent from overuse. Decide if the brush is in optimal condition or if it needs to be replaced.

[Short Pause] (10s - Handling the brush)

And now, pay attention to how you prepare the toothbrush and toothpaste. Register which hand is holding the tube and how you manage the cap.

Analyze the mechanics of the squeeze. Estimate the volume of toothpaste you apply to the brush. Decide if this is the correct ratio for cleaning.

[Short Pause] (10s - Preparation)

And then, tracking the process of bringing the toothbrush to your mouth. Did you move quickly, or was the movement slow and controlled?

And now, begin to brush the teeth. Register exactly where in the mouth you started.

Evaluate the toothpaste. Is the consistency smooth, or does it have a gritty quality? Focus on

the physical texture of the toothpaste and the friction of the bristles against your teeth.

Stay with the practice of monitoring the cleaning process for a few moments.

[Long Pause] (25s - Active brushing)

While you are brushing, you might start thinking about your day or hear outside noises. If you get distracted, drop those thoughts immediately. They are not part of your current job. Bring your focus straight back to the physical steps of brushing your teeth

With focus, pay attention to the movement of your arm. Analyze your technique. Are you brushing in circular motions, or are you moving back and forth?

[Short Pause] (10s - Brushing analysis)

How is the brush contacting the surface of the teeth? Judge the pressure you are applying. Are you pressing too hard, or is the pressure too soft to be effective?

Divide your mouth into four distinct quadrants. Ensure you are spending an equal amount of time on each section. Brush in a systematic way that covers every surface area.

[Short Pause] (10s - Tactile focus)

You might even listen to the sound of the brushing. Classify the sound. Is it loud and scratchy, or is it soft and quiet?

[Short Pause] (10s - Auditory focus)

How do you determine that the teeth are clean enough? What is your standard for finishing the task?

And now when you're ready, turn on the water. Check the flow rate of the tap. Test the temperature of the water with your fingers. Decide if it is too cold or too warm for rinsing.

As you rinse and gargle, turn your attention to the mechanics. Monitor the muscle action required for gargling. Assess the effectiveness of the rinse.

[Short Pause] (10s - Rinsing)

Count how many times you rinse the mouth to ensure it is clear.

And when the teeth seem clean or you are ready to stop, maintain your focus on the clean-up process. Are you speeding up?

Inspect the sink. Check if you left any foam residue or water drops. Use these final moments to ensure the area is clean and the tool is put away correctly.

[Pause] (20s - Final integration)

Now bring this analysis to a close.

Thank you for your practice.
