Title: Orientation (Variation B)

Duration: 2m 00s (**218** words; 207 words + 11w Bridge)

Script Content:

[Intro]

Welcome to this practice. Today we will explore the concept of Orientation.

To reach a destination, you must first know exactly where you are. Orientation is the physical skill of checking your current position.

In daily life, any complex system will slowly drift off target over time. A mechanical clock loses a few seconds every month. A compass needle might pull slightly away from true north. The system loses its exact alignment without us noticing. If we do not actively measure our tools, these small errors build up. A machine cannot fix itself; it requires an operator to run a test.

Think of a pilot flying a plane. They do not simply start the engine and let the plane float through the sky. They are constantly active. They scan the dashboard. They check the altitude. They verify the course.

If the wind pushes the plane off track, they steer it back into place right away. They constantly check their instruments to stay on the right path.

When we practice Orientation, we act like that pilot. We take manual control. We look at physical facts, verify our exact status, and correct any errors. We make sure our machine is perfectly lined up and pointing in the right direction.

[Bridge] Now, we will move into a short practice to explore this.
